(54) Title: BREAKAWAY SUPPORT POST FOR HIGHWAY GUARDRAIL END TREATMENTS

## (57) Abstract

A breakaway support post (18, 210) is provided for a highway guardrail system (10) to enhance the safety of a vehicle impacting with either the rail face of the associated guardrail (16) or one end of the guardrail facing oncoming traffic. The breakaway support post may have upper and lower portions (26, 28) with a releasable coupling assembly (29, 211) disposed therebetween to maintain the upper and lower portions generally aligned with each other prior to the impact of a vehicle with one end of the associated guardrail. The breakaway support post may also have releasable coupling assembly (301) disposed between the upper and lower portions and a cable (303). The releasable coupling assembly may allow the upper portion to separate from the lower portion.

BREAKAWAY SUPPORT POST FOR  
HIGHWAY GUARDRAIL END TREATMENTS

TECHNICAL FIELD OF THE INVENTION

5       The present invention relates to highway guardrail systems having a guardrail mounted on posts, and more particularly, to guardrail end treatments designed to meet applicable federal and state safety standards including but not limited to crash worthiness requirements.

BACKGROUND OF THE INVENTION

10       Along most highways there are hazards which present substantial danger to drivers and passengers of vehicles if the vehicles leave the highway. To prevent accidents from a vehicle leaving a highway, guardrail systems are often provided along the side of the highway. Experience  
15       has shown that guardrails should be installed such that the end of a guardrail facing oncoming traffic does not present another hazard more dangerous than the original hazard requiring installation of the associated guardrail systems. Early guardrail systems often had no protection  
20       at the end facing oncoming traffic. Sometimes impacting vehicles became impaled on the end of the guardrail causing extensive damage to the vehicle and severe injury to the driver and/or passengers. In some reported cases, the guardrail penetrated directly into the passenger's  
25       compartment of the vehicle fatally injuring the driver and passengers.

      Various highway guardrail systems and guardrail end treatments have been developed to minimize the

consequences resulting from a head-on impact between a vehicle and the extreme end of the associated guardrail. One example of such end treatments includes tapering the ends of the associated guardrail into the ground to  
5 eliminate potential impact with the extreme end of the guardrail. Other types of end treatments include breakaway cable terminals (BCT), vehicle attenuating terminals (VAT), the SENTRE end treatment, and breakaway end terminals (BET).

10 It is desirable for an end terminal assembly installed at one end of a guardrail facing oncoming traffic to attenuate any head-on impact with the end of the guardrail and to provide an effective anchor to redirect a vehicle back onto the associated roadway after  
15 a rail face impact with the guardrail downstream from the end terminal assembly. Examples of such end treatments are shown in U.S. Patent 4,928,928 entitled *Guardrail Extruder Terminal*, and U.S. Patent 5,078,366 entitled *Guardrail Extruder Terminal*.

20 A SENTRE end treatment often includes a series of breakaway steel guardrail support posts and frangible plastic containers filled with sandbags. An impacting vehicle is decelerated as the guardrail support posts release or shear and the plastic containers and sandbags  
25 are compacted. A cable is often included to guide an impacting vehicle away from the associated guardrail.

A head-on collision with a guardrail support post located at the end of a guardrail system may result in vaulting the impacting vehicle. Therefore, guardrail end  
30 treatments often include one or more breakaway support posts which will yield or shear upon impact by a vehicle. Examples of previously available breakaway posts are shown in U.S. Patent 4,784,515 entitled *Collapsible Highway Barrier*, and U.S. Patent 4,607,824 entitled  
35 *Guardrail End Terminal*. Posts such as shown in the '515

and the '824 Patents include a slip base with a top plate and a bottom plate which are designed to not yield upon lateral impact. When sufficient axial impact force is applied to the upper portion of the associated post, the top plate and the bottom plate will slide relative to each other. If a vehicle contacts the upper part of the post, the associated impact forces tend to produce a bending moment which may reduce or eliminate any slipping of the top plate relative to the bottom plate. Also, improper installation of the top plate relative to the bottom plate, such as over tightening of the associated mechanical fasteners, may prevent proper functioning of the slip base. A breakaway support post is also shown in U.S. Patent 5,503,495 entitled *Thrie-Beam Terminal with Breakaway Post Cable Release*.

Wooden breakaway support posts are frequently used to releasably anchor guardrail end treatments and portions of the associated guardrail. Such wooden breakaway support posts, when properly installed, generally perform satisfactorily to minimize damage to an impacting vehicle during either a rail face impact or a head-on impact. However, impact of a vehicle with a wooden breakaway support post may often result in substantial damage to the adjacent soil. Removing portions of a broken wooden post from the soil is often both time consuming and further damages the soil. Therefore, wooden breakaway support posts are often installed in hollow metal tubes, sometimes referred to as foundation sleeves, and/or concrete foundations. For some applications, one or more soil plates may be attached to each metal sleeve to further improve the breakaway characteristics of the associated wooden post. Such metal sleeves and/or concrete foundations are relatively expensive and time consuming to install.

Light poles, sign posts or similar items are often installed next to a roadway with a breakable or releasable connection. For some applications, a cement foundation may be provided adjacent to the roadway with three or more bolts projecting from the foundation around the circumference of the pole. Various types of frangible or breakable connections may be formed between the bolts and portions of the light pole or sign post.

Other possible solutions to the problems discussed are found in U.S. Patent Application 09/074,496, filed May 7, 1998, entitled *Breakaway Metal Post for Highway Guardrail End Treatments*, and U.S. Provisional Application 60/046,015 filed May 9, 1997, entitled *A Breakaway Metal Post for Highway Guardrail End Treatments*. These solutions have been adequate for their intended purposes, but are not satisfactory in all respects. For example, previous breakaway support post designs have not included reusable parts. For another example, previous breakaway support post designs have included parts which require extensive machining.

#### SUMMARY OF THE INVENTION

From the foregoing, it may be appreciated that a need has arisen for an apparatus for a breakaway support post for mounting a guardrail thereon as part of a highway guardrail system which is cheaper and more reusable than previous designs. According one form of to the present invention, this need is met by such a breakaway support post which includes an elongated body having an upper portion including a first upper end and a first lower end, and a lower portion including a second upper end and a second lower end. The second lower end is insertable into the soil adjacent to a roadway. The first lower end has a first substantially vertical surface thereon and the second upper end has a second

substantially vertical surface thereon. A first arrangement attaches the guardrail to the elongated body adjacent to the first upper end. A second arrangement rotatably couples the upper and lower portions, and  
5 releasably secures the upper portion of the elongated body generally aligned with the lower portion of the elongated body, wherein the breakaway support post will resist a rail face impact with the guardrail and wherein an impact with one end of the attached guardrail will  
10 tend to rotate the upper portion of the elongated body relative to the lower portion of the elongated body. The second arrangement includes a first plate having a first opening and a second opening therethrough, and having a third substantially vertical surface thereon. A portion  
15 of the third substantially vertical surface is disposed against a portion of the first substantially vertical surface. The first plate is secured to the first lower end by a weld. The second arrangement further includes a second plate having a third opening and a fourth opening  
20 therethrough, and having a fourth substantially vertical surface thereon. A portion of the fourth substantially vertical surface is disposed against a portion of the second substantially vertical surface. The second plate is secured to the second upper end by a weld. The second  
25 plate is disposed adjacent to the first plate so that the first opening is aligned with the third opening, and the second opening is aligned with the fourth opening. A pivot pin portion extends through the first and third openings. The upper portion of the elongated body is  
30 rotatable about the pivot pin portion relative to the lower portion of the elongated body. A shear pin portion extends through the second and fourth openings. The shear pin portion is adapted to shear in response to a  
35 force to allow pivotal movement of the upper portion relative to the lower portion around the pivot pin

portion. The pivot pin portion and the shear pin portion extend in a strong direction approximately perpendicular to the plates. The support post exhibits a high mechanical strength in the strong direction, there also being a weak direction that is generally perpendicular to the strong direction, wherein the support post exhibits a low mechanical strength in the weak direction.

According to a different form of the present invention, a highway guardrail system includes an elongated guardrail. The highway guardrail system further includes a support post having a strong direction generally perpendicular to the guardrail, and a weak direction generally parallel to the guardrail, wherein the support post exhibits a high mechanical strength in the strong direction, and the support post exhibits a lower mechanical strength in the weak direction than in the strong direction, and the support post includes an elongated body having an upper portion and a lower portion, the lower portion being insertable into the soil adjacent to a roadway. The highway guardrail system further includes an attaching arrangement for attaching the guardrail to the support post adjacent to an upper end of the upper portion of the support post and a coupling arrangement for yieldly retaining the upper portion in an upright position relative to the lower portion, the coupling arrangement having a greater resistance to forces exerted on the upper portion in the strong direction than to forces exerted on the upper portion in the weak direction, and wherein in response to a force exerted in the weak direction which is greater than a predetermined amount of force, the coupling arrangement will permit the upper portion to move away from the upright position relative to the lower portion. The highway guardrail system further includes a cable having a first end and a second end, and a releasable

arrangement for releasably maintaining the first end of the cable in an initial position relative to the post when the upper portion is in the upright position relative to the lower portion and for permitting the first end of the cable to move away from the initial position when the upper portion moves away from the upright position.

#### BRIEF DESCRIPTION OF THE DRAWINGS

For a more complete understanding of the present invention, and the advantages thereof, reference is now made to the following written description taken in conjunction with the accompanying drawings, in which:

FIGURE 1 is a schematic drawing showing an isometric view with portions broken away of a highway guardrail system having a breakaway support post with a guardrail mounted thereon in accordance with an embodiment of the present invention;

FIGURE 2 is a schematic drawing with portions broken away showing a side view of the breakaway support post of FIGURE 1 in its upright position;

FIGURE 3 is a schematic drawing with portions broken away showing a rear view of the breakaway support post of FIGURE 1 in its upright position;

FIGURE 4 is a schematic drawing similar to FIGURE 3, but showing the breakaway support post rotating from its upright position to an angled position in response to a force applied to the breakaway support post in one direction corresponding with an impact by a vehicle with one end of the associated guardrail;

FIGURE 5 is a schematic drawing with portions broken away showing a rear view of a further embodiment of the support post of FIGURE 1 in an upright position;

FIGURE 6 is a schematic drawing with portions broken away showing a side view of the embodiment of the breakaway support post FIGURE 5 in the upright position;

FIGURE 7 is a schematic drawing of an exploded view of the breakaway support post in FIGURE 5 showing only an upper portion and a lower portion thereof; and

FIGURE 8 is a schematic drawing with portions broken away showing a rear view of the breakaway support post of FIGURE 5.

#### DETAILED DESCRIPTION OF THE INVENTION

The preferred embodiments of the present invention and its advantages are best understood by referring now in more detail to FIGURES 1-8 of the drawings, in which like numerals refer to like parts.

FIGURE 1 is a schematic drawing showing an isometric view with portions broken away of a highway guardrail system 10 having a breakaway support post 18 with a guardrail 16 mounted thereon in accordance with an embodiment of the present invention. Referring to FIGURE 1, the highway guardrail system 10 is typically installed along the edge of a highway or roadway (not expressly shown) adjacent to a hazard (not expressly shown) to prevent a vehicle (not shown) from leaving the associated highway or roadway.

Guardrail system 10 is primarily designed and installed along a highway to withstand a rail face impact from a vehicle downstream from an associated end treatment. Various types of guardrail end treatments (not expressly shown) are preferably provided at the end of guardrail 16 facing oncoming traffic. Examples of guardrail end treatments satisfactory for use with the present invention are shown in U.S. Patent 4,655,434 entitled *Energy Absorbing Guardrail Terminal*; U.S. Patent 4,928,928 entitled *Guardrail Extruder Terminal*; and U.S.

Patent 5,078,366 entitled *Guardrail Extruder Terminal*.

Such guardrail end treatments extend substantially parallel with the associated roadway. U.S. Patent 4,678,166 entitled *Eccentric Loader Guardrail Terminal*

5 shows a guardrail end treatment which flares away from the associated roadway. U.S. Patents 4,655,434;

4,928,928; 5,078,366; and 4,678,166 are incorporated herein by reference. When this type of guardrail end treatment is hit by a vehicle, the guardrail will

10 normally release from the associated support post and allow the impacting vehicle to pass behind downstream portions of the associated guardrail. However, breakaway support posts incorporating teachings of the present invention may be used with any guardrail end treatment or  
15 guardrail system having satisfactory energy-absorbing characteristics for the associated roadway and anticipated vehicle traffic.

The support post 18 has a strong direction 21 and a weak direction 23. When the post is subjected to an  
20 impact from the strong direction 21, the post exhibits a high mechanical strength. The strong direction 21 is oriented perpendicular to the guardrail 16. Thus, when the post is impacted by a vehicle in the strong direction 21 (such as when the vehicle impacts the face of the  
25 guardrail), the post will remain intact and standing, and the vehicle will be redirected back onto the road. The weak direction 23 is oriented parallel to the guardrail. When the post is subjected to an impact from the weak direction 23, the post exhibits low mechanical strength.  
30 Thus, when the post is impacted by a vehicle in the weak direction 23 (such as when the vehicle impacts the end of the guardrail), the portion of the post that is substantially above the ground will yield, so as to avoid presenting a substantial barrier to the vehicle.

35 Preferably, the upper portion of the post will deflect,

in order to minimize lifting of the impacting vehicle into the air.

One or more support posts 18 are preferably incorporated into the respective guardrail end treatment to substantially minimize damage to a vehicle during a head-on impact with the end of guardrail 16 facing oncoming traffic. The number of support posts 18 and the length of guardrail 16 may be varied depending upon the associated roadway, the hazard adjacent to the roadway requiring installation of highway guardrail system 10, anticipated vehicle traffic on the associated roadway, and the selected guardrail end treatment. As discussed later in more detail, breakaway support posts 18 will securely anchor guardrail 16 during a rail face impact or front impact with guardrail 16 to redirect an impacting vehicle back onto the associated roadway. Support posts 18 will yield or buckle during a head-on impact with the end of guardrail 16 without causing excessive damage to an impacting vehicle.

Various techniques which are well known in the art may be satisfactorily used to install the breakaway support post 18, depending upon the type of soil conditions and other factors associated with the roadway and the hazard requiring installation of respective highway guardrail system 10. For many applications, the breakaway support post 18 may be simply driven into the soil using an appropriately sized hydraulic and/or pneumatic driver. As a result, the breakaway support post 18 may be easily removed from the soil using an appropriately sized crane or other type of pulling tool. For many applications, the breakaway post 18 may be satisfactorily used to install guardrail 16 adjacent to an associated roadway without the use of metal foundation tubes or other types of post-to-ground installation systems such as concrete with a steel slip base support.

U.S. Patent 5,503,495, entitled *Thrie-Beam Terminal With Breakaway Post Cable Release*, shows one example of a breakaway support post with this type of foundation.

Support posts 18 may be fabricated from various types of steel alloys or other materials with the desired strength and/or breakaway characteristics appropriate for the respective highway guardrail system 10. For some applications, a breakaway support post incorporating teachings of the present invention may be fabricated from ceramic materials or a mixture of ceramic and metal alloys which are sometimes referred to as cermets.

Referring to FIGURE 1, the support post 18 includes an upper portion 26 and a lower portion 28 which are pivotally coupled by a rotatable coupling mechanism 29. Both the upper and lower portions 26 and 28 are steel I-beams. The upper portion 26 includes a flange 31 and a flange 33, with a web 36 extending between them. The flanges 31 and 33 are generally parallel to the guardrail 16. The web 36 is generally perpendicular to the flanges 31 and 33 and the guardrail 16. The flanges 31 and 33 have substantially vertical surfaces 38 and 41, respectively, on the sides thereof opposite the sides to which the web 36 is coupled. The rotatable coupling mechanism 29 includes four metal plates 71, 83, 98, and 111 and three bolts 126, 128, and 131. The mechanism 29 rotatably couples the upper portion 26 to the lower portion 28. In the described embodiment, the upper and lower portions 26 and 28 have the same general I-shaped cross-section. Alternatively, for some applications, the upper portion 26 could have a cross-section which is substantially different from the cross-section of the lower portion 28. For example, the upper portion 26 may be an I-beam, while the lower portion 28 may be a hollow or solid cylindrical post, or a hollow or solid square post, or some other shape.

The lower portion 28 includes a flange 46 and a flange 48, with a web 51 extending between them. The flanges 46 and 48 have substantially vertical surfaces 53 and 56 on the sides thereof opposite to the sides to which the web 51 is coupled. The flanges 46 and 48 are generally parallel to the guardrail 16 and are generally aligned in horizontal directions with the flanges 31 and 33, respectively. The web 51 is generally perpendicular to the flanges 46 and 48, and is generally aligned in horizontal directions with the web 36.

In FIGURE 1, highway guardrail system 10 is shown with a typical deep W-beam twelve (12) gauge type guardrail 16. For some applications, a thrie beam guardrail may be satisfactorily used. Other types of guardrails, both folded and non-folded, may be satisfactorily used with the breakaway support post 18 of the present invention.

The upper portion 26 includes an upper end 58 and a lower end 61. The lower portion 28 includes an upper end 63 and a lower end 66. A block 68 forms a lateral offset between the guardrail 16 and the support post 18. The block 68 is fixedly coupled to the guardrail 16 and the support post 18.

A clearer understanding of the present invention is gained by considering FIGURES 1 and 2 together. FIGURE 2 is a schematic drawing with portions broken away showing a side view of the breakaway support post 18 of FIGURE 1 in its upright position.

Referring to FIGURES 1 and 2, the flat metal plate 71 has sides which are substantially vertical surfaces 73 and 76 and is of a generally rectangular shape. The plate 71 includes two horizontally spaced cylindrical openings 78 and 81 therethrough (shown in FIGURE 2). The plate 71 further includes a first edge 79 and a second edge 80, the first edge 79 facing generally toward the

direction of an expected impact in the weak direction 23, the second edge 80 facing generally away from the direction of the expected impact in the weak direction 23. The plate 71 further includes a chamfer 82 (shown in FIGURES 3-4) disposed between a bottom edge and a lower portion of the second edge 80 of the plate 71. In the disclosed embodiment, the chamfer extends at an angle of 45° with respect to each of the bottom edge and the second edge 80 of plate 71. The plate 71 is disposed against the substantially vertical surface 38 of the lower end 61 and is fixedly secured to the lower end 61 by a weld (not illustrated). The plate 71 is disposed against the lower end 61 such that a portion of the substantially vertical surface 76 overlaps a portion of the substantially vertical surface 38. The extent of the overlap between the plate 71 and the lower end 61 may be seen in greater detail in FIGURE 2.

As mentioned above, the coupling mechanism 29 includes three additional plates 83, 98, and 111. These three additional plates are each substantially identical to plate 71, but are each described below for purposes of completeness. The flat metal plate 83 has a generally rectangular shape and has sides which are substantially vertical surfaces 86 and 88. The plate 83 includes two horizontally spaced cylindrical openings 91 and 93 therethrough (shown in FIGURE 2). The plate 83 further includes a first edge and a second edge, the first edge facing generally toward the direction of an expected impact in the weak direction 23, the second edge facing generally away from the direction of the expected impact in the weak direction 23. The plate 83 further includes a chamfer 96 (also shown in FIGURES 3-4) disposed between a top edge and an upper portion of the second edge of the plate 83. The plate 83 is disposed against the upper end 63 and is fixedly secured to the upper end 63 by a weld

(not-illustrated). The upper end of plate 83 is disposed adjacent and overlaps the lower end of plate 71 so that the cylindrical openings 78 and 91 are aligned, and the cylindrical openings 81 and 93 are aligned. A portion of the substantially vertical surface 88 remote from plate 71 is disposed adjacent to a portion of the substantially vertical surface 53.

The flat metal plate 98 is of a generally rectangular shape and has sides forming substantially vertical surfaces 101 and 103. The plate 98 includes two horizontally spaced cylindrical openings 106 and 108 therethrough (shown in FIGURE 2). The plate 98 further includes a first edge and a second edge, the first edge facing generally toward the direction of an expected impact in the weak direction 23, and the second edge facing generally away from the direction of the expected impact in the weak direction 23. The plate 98 further includes a chamfer (not shown) disposed between a bottom edge and a lower portion of the second edge of the plate 98. The plate 98 is disposed against the lower end 61 and is fixedly secured to the lower end 61 by a weld (not-illustrated). A portion of the substantially vertical surface 103 is disposed against and overlaps a portion of the substantially vertical surface 41.

The flat metal plate 111 is of a generally rectangular shape and has sides that form substantially vertical surfaces 113 and 116. The plate 111 includes two horizontally spaced cylindrical openings 118 and 121 therethrough (shown in FIGURE 2). The plate 111 further includes a first edge and a second edge, the first edge facing generally toward the direction of an expected impact in the weak direction 23, the second edge facing generally away from the direction of the expected impact in the weak direction 23. The plate 111 further includes a chamfer (not shown) disposed between a top edge and an

upper portion of the second edge of the plate 111. The plate 111 is disposed against the upper end 63 and is fixedly secured to the upper end 63 by weld (not shown). A portion of the substantially vertical surface 116 is  
5 disposed against and overlaps a portion of the substantially vertical surface 56. The plates 98 and 111 are disposed adjacent and overlap each other so that the openings 106 and 118 are aligned, and the openings 108 and 121 are aligned.

10 The openings 78, 91, 106, and 118 are coaxial and are disposed closer to the second edges than to the first edges of the plates 71, 83, 98, and 111, respectively. The openings 81, 93, 108, and 121 are coaxial and are disposed closer to the first edges than to the second  
15 edges of the plates 71, 83, 98, and 111, respectively.

Referring to FIGURE 2, a pivot bolt 126 extends through the aligned cylindrical openings 78, 91, 106, and 118 in the plates 71, 83, 98, and 111. The pivot bolt 126 rotatably couples the plate 83 to the plate 71, and  
20 the plate 98 to the plate 111. A shear bolt 128 extends through the cylindrical openings 81 and 93 in the plates 71 and 83. A further shear bolt 131 extends through the cylindrical openings 108 and 121 in the plates 98 and 111. The shear bolts 128 and 131 are generally  
25 vertically aligned with and are generally parallel to the pivot bolt 126. The shear bolt 128 releasably secures the plates 71 and 83 against relative rotational movement. The shear bolt 131 releasably secures the plates 98 and 111 against relative rotational movement.  
30 The shear bolts 128 and 131 each have a diameter smaller than the diameter of the pivot bolt 126.

The pivot bolt 126 has a head 133 and threads 136. A nut 138 engages the threads 136 to secure the pivot bolt 126 against axial movement within the openings 78,  
35 91, 106, and 118. The head 133 is disposed against the

substantially vertical surface 86 on the plate 83. The  
nut 138 is disposed against the substantially vertical  
surface 101 on the plate 98. The shear bolt 128 has a  
head 141 and threads 143. A nut 146 engages the threads  
5 143 to secure the shear bolt 128 against axial movement  
within the openings 81 and 93. The head 141 is disposed  
against the substantially vertical surface 86 on the  
plate 83. The nut 146 is disposed against the  
substantially vertical surface 76 on the plate 71. The  
10 shear bolt 131 has a head 148 and threads 151. A nut 153  
engages the threads 151 to secure the shear bolt 131  
against axial movement within the openings 108 and 121.  
The head 148 is disposed against the substantially  
vertical surface 101 of the plate 98. The nut 153 is  
15 disposed against the substantially vertical surface 116  
of the plate 111.

Depending on the length of the lower end 66 and the  
type of soil conditions, a plurality of soil plates 123  
may be attached to the lower end 66 so as to extend  
20 outwardly from the flanges 46 and 48. As a result of  
increasing the length of the lower end 66, the use of the  
soil plates 123 may not be required.

FIGURE 3 is a schematic drawing with portions broken  
away showing a rear view of the breakaway support post 18  
25 of FIGURE 1 in its upright position. FIGURE 4 is a  
schematic drawing similar to FIGURE 3, showing the  
breakaway support post 18 rotating from the upright  
position to the angled position in response to a force  
applied in the weak direction 23. In the upright  
30 position, the post 18 is upright with the upper portion  
26 generally rectilinearly aligned with the lower portion  
28. In the angled position, the upper portion 26 has  
rotated due to an impact from the weak direction 23 and  
forms an angle with respect to the lower portion 28.

An alternative embodiment 210 of the breakaway support post 18 of FIGURE 1 is shown in FIGURES 5, 6 and 7. Only the differences between these posts are described in detail below.

5 Referring to FIGURES 5 and 6, a releasable coupling assembly 211 rotatably couples the upper and lower portions 26 and 28 of the post, and includes four metal plates 213, 216, 218, and 221, and four bolts 223, 226, 228, and 231.

10 Referring to FIGURES 5, 6, and 7, the flat metal plate 213 includes a bottom edge 233 and a side edge 236, the side edge facing generally away from the direction of an expected impact in the weak direction 23. An inclined edge 237 faces downwardly and away from the direction of  
15 the expected impact in the weak direction 23, and in particular extends at an angle of 45° with respect to each of the bottom edge 233 and the side edge 236, and thus at an angle of 45° with respect to a vertical reference when the upper portion 26 is in the upright  
20 position. The plate 213 further includes a cylindrical opening 238 therethrough and a semicylindrical recess 241 disposed in the inclined edge 237 (FIGURE 7). The plate 213 is disposed against the upper portion 26 such that a portion of the plate 213 overlaps a portion of the upper  
25 portion 26 and is fixedly secured to the upper portion 26 by a weld (not illustrated). The extent of the overlap between the plate 213 and the lower portion 26 may be seen in greater detail in FIGURE 6.

The flat metal plate 216 has a generally rectangular  
30 shape. Plate 216 includes two horizontally spaced cylindrical openings 243 and 246 therethrough (FIGURE 7). The plate 216 further includes a top edge 244 and a side edge 245, the side edge 245 facing generally away from the direction of the expected impact in the weak  
35 direction 23. The plate 216 further includes a chamfer

248 disposed between the top edge 244 and the side edge 255. The chamfer 248 extends at an angle of 45 degrees with respect to the top and side edges 244 and 245. The plate 216 is disposed against the lower portion 28 such that a portion of the plate 216 overlaps a portion of the lower portion 28 and is fixedly secured to the lower portion 28 by a weld (not illustrated). An upper end of plate 216 is disposed adjacent and overlaps the lower end of plate 213 (FIGURE 6) so that the cylindrical openings 238 and 243 are aligned, and the recess 241 and the cylindrical opening 246 are aligned. The extent of the overlap between the plate 216 and the lower portion 28 may be seen in greater detail in association with FIGURE 6.

The coupling assembly 211 includes two additional plates 218 and 221 as shown in FIGURE 6. Plate 218 is substantially similar to plate 213, and plate 221 is substantially similar to plate 216.

More specifically, the plate 218 includes a cylindrical opening 251 similar to the cylindrical opening 238 and a semicylindrical recess 253 similar to the recess 241. The plate 221 includes two horizontally spaced cylindrical openings 256 and 258 similar to the cylindrical openings 243 and 246, respectively.

Referring to FIGURE 6, the openings 238 and 243 are coaxial, the openings 251 and 256 are coaxial, and the recess 241 and the opening 246 are coaxial. The opening 246, opening 258, recess 241, and recess 253 are each spaced horizontally in the direction 23 from openings 243, 256, 238, and 251, respectively.

Referring to FIGURES 5 and 6, a rigid strut 291 is generally L-shaped in cross-section and includes near one end a cylindrical opening therethrough (not shown). The strut 291 has a first end 293 disposed adjacent the plate 216 and coupled thereto by the pivot bolt 226 which

extends through the cylindrical opening in the strut 291. The strut 291 further has a second end 296, opposite from the first end 293, coupled to a further support post 298.

The pivot bolt 226 extends through the cylindrical opening 246 and is engageable with the recess 241. The other pivot bolt 228 extends through the cylindrical opening 246, the opening in the strut 291, and is engageable with the recess 253. The pivot bolts 226 and 228 are also coaxial with each other.

The shear bolt 223 extends through the cylindrical openings 238 and 243. The other shear bolt 231, similar to shear bolt 226, extends through the cylindrical openings 243 and 253. The shear bolts 223 and 231 are generally vertically aligned with and parallel to the pivot bolts 226 and 228. The shear bolt 223 releasably secures the plates 213 and 216 against relative pivotal movement in one direction, and the shear bolt 231 releasably secures the plates 218 and 221 against relative pivotal movement in one direction. The shear bolts 223 and 231 each have a diameter smaller than the diameter of the pivot bolts 226 and 228.

The pivot bolt 226 has a head 261 and threads 263. A nut 266 engages the threads 263 to secure the pivot bolt 226 against axial movement relative with respect to plates 213 and 216, and strut 291. The nut 266 further secures the strut 291 against relative movement to the post 210. Similar to pivot bolt 226, the pivot bolt 228 has a head 268 and threads 271. A nut 273 engages the threads 271 to secure the pivot bolt 228 against axial movement relative to plates 218 and 221. The shear bolt 223 has a head 276 and threads 278. A nut 281 engages the threads 278 to secure the shear bolt 223 against axial movement within the openings 238 and 243. Similar to shear bolt 223, shear bolt 231 includes a head 283 and threads 286. A nut 288 engages the threads 286 to secure

the shear bolt 231 against axial movement within the openings 251 and 256.

FIGURE 8 is a schematic drawing with portions broken away showing a rear view of the breakaway support post 210 of FIGURE 5 following a release of the coupling assembly 211. Referring to FIGURES 5 and 8, a cable 303 and a releasable cable coupling mechanism 301 are shown. The releasable coupling mechanism 301 includes an anchor plate 306 and a nut 308. The cable may be any of a variety of industry standard metal cables.

The anchor plate 306 is a flat metal plate of a generally rectangular shape. The anchor plate 306 has an aperture therethrough (not shown). As shown in FIGURE 5, the anchor plate 306 is normally disposed against the lower end of the upper portion 26. The anchor plate 306 may also overlap the lower portion 28 or be in some other appropriate location with respect to the support post 210.

The cable 303 has a first end portion 311 and a second end portion (not shown) at a remote end. The second end portion is coupled to the highway guardrail system 10 at a location remote from the first end portion. In this embodiment, the first end portion 311 includes a threaded stud 312. The cable further includes a flexible portion 313 and a mating part 316. The mating part 316 couples the flexible portion 313 to the threaded stud 312. The first end portion 311 extends through the aperture of the anchor plate 306 and further extends away from the anchor plate 306 between the upper and lower portions 26 and 28. The cable 303 engages the web 36, but could alternatively engage the web 51, or further extend in some other appropriate manner away from the anchor plate 306. The first end portion of the cable 311 is fixedly secured against withdrawal from the opening in

the anchor plate 306 by the nut 308 which engages the threaded stud 312.

The breakaway support post 18 of FIGURES 1-4 operates as follows. In the upright position of the upper portion 26 (FIGURE 3), the upper and lower portions 26 and 28 are generally parallel. The coupling mechanism 29 prevents the upper portion 26 from rotating relative to the lower portion 28 around the pivot bolt 126. When a vehicle impacts the guardrail system 10 with sufficient force from the weak direction 23, the shear bolt 128 will be sheared by scissors-like interaction of the plates 71 and 83, and the shear bolt 131 will be sheared by scissors-like interaction of the plates 98 and 111. The pivot bolt 126 does not fail during the impact because the pivot bolt 126 has a diameter large enough to avoid failure, and in particular has a larger diameter than the diameter of the shear bolts 128 and 131. Once the shear bolts fail, the upper portion 26 will rotate away from the impacting vehicle about the pivot bolt 126. The openings 81 and 93 (shown in FIGURE 4) and the openings 108 and 121 (not shown in FIGURE 4) move out of alignment as the upper portion 26 rotates. Chamfers 82 and 96 allow the upper portion 26 to rotate while avoiding engagement of the plates 71, 83, 98, and 111 with the webs 36 and 51 and the flanges 31, 33, 46, and 48. The rotation of the upper portion 26 will collapse the guardrail 16 and protect the occupants of the impacting vehicle from being impaled on the guardrail 16.

The further embodiment of the breakaway support post shown as 210 in FIGURES 5-8 operates as follows. In the upright position (shown in FIGURE 5), the upper and lower portions 26 and 28 are generally parallel. As shown in FIGURE 5, the anchor plate 306 is disposed against the upper portion 26 when the upper portion 26 is in the upright position, and the cable 303 is maintained under

tension. The anchor plate 306 operates to secure the cable 303 against relative movement with respect to the support post 210.

5 The releasable coupling assembly 211 allows the upper portion 26 to separate from the lower portion 28 in response to a force in the weak direction 23. When a vehicle impacts the breakaway support post 210 with sufficient force in the weak direction 23, the shear bolt 223 will be sheared by scissors-like interaction of the  
10 plates 213 and 216, and the shear bolt 231 will be sheared by scissors-like interaction of the plates 218 and 221. The pivot bolts 226 and 228 do not fail during the impact because the pivot bolts 226 and 228 have a diameter large enough to avoid failure, and, in  
15 particular, have a diameter larger than the diameter of the shear bolts 223 and 231. Once the shear bolts 223 and 231 have failed the upper portion 26 will typically pivot a small amount about the pivot bolts 226 and 228, and then physically separate from the lower portion 28  
20 (FIGURE 8).

As shown in FIGURE 8, as the upper portion 26 physically separates from the lower portion 28 the anchor plate 306 is no longer secured by the upper portion 26. Thus, the anchor plate 306 is able to move away from the  
25 anchor plate's initial position. Thus, once the anchor plate 306 is released from the upper portion 26 the cable 303 is also free to move while remaining coupled to the anchor plate.

30 The present invention provides a number of technical advantages. One such technical advantage is the capability of the support post to yield in response to the impact of a vehicle at the end of a guardrail. Yielding in response to the impact by the vehicle results  
35 in a decreased chance of injury to occupants of the vehicle. Another advantage is that the flat metal plates

can be fabricated rapidly and inexpensively. A further advantage is that the plates are welded onto standard I-beams, which allows the support post to be made easily and cheaply. Moreover, the pivot and shear bolts may be commercially available components, which also reduces the overall cost of manufacturing the post. Further cost savings are realized by reusing the upper and lower portions after an impact, by replacing only the shear bolts. If the upper portion is damaged by an impact, only the upper portion and the shear bolts need to be replaced, and cost savings are realized by reusing the lower portion. When a cable is present, a simple and inexpensive retaining arrangement is provided to retain an end of the cable until an impact occurs, and to then release the end of the cable so that it can move freely. Further, a simple and inexpensive arrangement is provided which permits an upper portion of a post to separate from a lower portion following an impact.

Although one embodiment has been illustrated and described in detail, it should be understood that various changes, substitutions, and alterations can be made therein without departing from the scope of the present invention. For example, although the disclosed support post is an I-beam, a square support post with a hollow center could be used instead. Other changes, substitutions, and alternations are also possible without departing from the spirit and scope of the present invention, as defined by the following claims.

WHAT IS CLAIMED IS:

1. A breakaway support post for mounting a guardrail thereon as part of a highway guardrail system comprising:

5 an elongated body having an upper portion including a first upper end and a first lower end, and a lower portion including a second upper end and a second lower end, the second lower end having a configuration for installation adjacent to a roadway, and the first lower  
10 end having a first substantially vertical surface thereon and the second upper end having a second substantially vertical surface thereon;

first means for attaching the guardrail to the elongated body adjacent to the first upper end; and

15 second means for rotatably coupling the upper and lower portions, and for releasably securing the upper portion of the elongated body generally aligned with the lower portion of the elongated body, wherein the breakaway support post will resist a rail face impact  
20 with the guardrail and wherein an impact with one end of the guardrail system will tend to rotate the upper portion of the elongated body relative to the lower portion of the elongated body, wherein the second means includes:

25 a first plate having a first opening and a second opening therethrough, and having a third substantially vertical surface thereon, a portion of the third substantially vertical surface being disposed against a portion of the first substantially vertical surface, and  
30 the first plate being secured to the first lower end by a weld;

a second plate having a third opening and a fourth opening therethrough, and having a fourth substantially  
35 substantially vertical surface being disposed against a

portion of the second substantially vertical surface, the second plate being secured to the second upper end by a weld, the second plate being disposed adjacent to the first plate so that the first opening is aligned with the third opening, and the second opening is aligned with the fourth opening;

a pivot pin portion extending through the first and third openings, the upper portion of the elongated body being rotatable about the pivot pin portion relative to the lower portion of the elongated body; and

a shear pin portion extending through the second and fourth openings, the shear pin portion being adapted to shear in response to a force to allow pivotal movement of the upper portion relative to the lower portion around the pivot pin portion, the pivot pin portion and the shear pin portion extending in a strong direction approximately perpendicular to the plates, wherein the support post exhibits a high mechanical strength in the strong direction, there being a weak direction that is generally perpendicular to the strong direction, wherein the support post exhibits a low mechanical strength in the weak direction.

2. The breakaway support post of Claim 1, wherein the first means includes a block disposed between the guardrail and the upper portion of the elongated body, the block being coupled to the first upper end and further being coupled to the guardrail, the block forming a lateral offset between the guardrail and the breakaway support post.

3. The breakaway support post of Claim 1 wherein the upper and lower portions each comprise:

5 a respective I-beam, the I-beams having a web with the web of the I-beam of the upper portion being generally aligned with the web of the I-beam of the lower portion;

the webs extending generally vertically and generally perpendicular to the guardrail; and

10 the I-beams each further having a pair of flanges attached to opposite sides of the web thereof with one flange having the first substantially vertical surface thereon and the other flange having the second substantially vertical surface thereon.

15 4. The breakaway support post of Claim 1, wherein the first and second plates each have a first edge and a second edge, the first edge facing generally toward the direction of an expected impact in the weak direction, and the second edge facing generally away from the  
20 direction of the expected impact in the weak direction, wherein the first plate further includes a chamfer disposed between a bottom edge thereof and a lower portion of the second edge thereof, and wherein the second plate further includes a chamfer disposed between  
25 a top edge thereof and an upper portion of the second edge thereof, the chamfers being positioned so that the upper portion of the elongated body may rotate relative to the lower portion of the elongated body free of engagement of the second and first plates with the upper  
30 and lower portions, respectively.

5. The breakaway support post of Claim 1, further including:

5 a fifth substantially vertical surface on a side of the upper portion opposite the side having the first substantially vertical surface;

a sixth substantially vertical surface on a side of the lower portion opposite the side having the second substantially vertical surface;

10 a third plate having fifth and sixth openings therethrough, and having a seventh substantially vertical surface thereon, a portion of the seventh substantially vertical surface being disposed against the fifth substantially vertical surface, and the third plate being secured to the first lower end by a weld;

15 a fourth plate having seventh and eighth openings therethrough, and having an eighth substantially vertical surface thereon, a portion of the eighth substantially vertical surface being disposed against the sixth substantially vertical surface, the fourth plate being  
20 secured to the second upper end by a weld, the fourth plate being disposed against the third plate, so that the fifth opening is aligned with the seventh opening and the sixth opening is aligned with the eighth opening, and the pivot pin portion further extending through the fifth and  
25 seventh openings in the strong direction; and

30 a further shear pin portion extending through the sixth and eighth openings in the strong direction, the further shear pin portion being adapted to shear in response to a force to allow pivotal movement of the upper portion relative to the lower portion around the pivot pin portion.

6. The breakaway support post of Claim 5 wherein the third and fourth plates each have a first edge and a second edge, the first edge facing generally toward the direction of an expected impact in the weak direction, and the second edge facing generally away from the direction of the expected impact in the weak direction, wherein the third plate further includes a chamfer disposed between a bottom edge thereof and a lower portion of the second edge thereof, and wherein the fourth plate further includes a chamfer disposed between a top edge thereof and an upper portion of the second edge thereof, the chamfers being positioned so that the upper portion of the elongated body may rotate relative to the lower portion of the elongated body free of engagement between the fourth and third plates and the upper and lower portions, respectively.

7. The breakaway support post of Claim 5, wherein the first, second, third, and fourth plates each comprise a flat plate and wherein each of the first, second, third and fourth plates further includes an inner side and an outer side, wherein the inner sides of the first, second, third, and fourth plates, respectively, include the third, fourth, seventh, and eighth substantially vertical surfaces, respectively, and the outer side of the first plate having a portion disposed adjacent to a portion of the inner side of the second plate, and a portion of the inner side of the third plate being disposed adjacent to a portion of the outer side of the fourth plate.

8. The breakaway support post of Claim 5, including a first shear pin and a second shear pin, the first shear pin extending through the second and fourth openings, and the second shear pin extending through the sixth and eighth openings, the first and second shear pins being co-axial, and extending in the strong direction, each of the first and second shear pins having a section which serves as a respective one of the shear pin portions.

9. The breakaway support post of Claim 8, wherein the first and second shear pins are each a shear bolt having a head at one end, and threads at an opposite end, and including two nuts which each engage the threads of a respective one of the shear bolts, and wherein the first and second shear bolts each have a diameter smaller than the diameter of the pivot pin portion.

10. The breakaway support post of Claim 1, wherein the first opening is defined in part by a recess provided in an edge of one of the plates.

11. A breakaway support post for mounting a guardrail thereon as part of a highway guardrail system comprising:

5 an elongated body having an upper portion and a lower portion, the upper portion of the elongated body having a first end, the lower portion of the elongated body having a second end which may be installed adjacent to a roadway;

10 first means for attaching the guardrail adjacent to the first end of the upper portion; and

second means for rotatably coupling the upper and lower portions, and for releasably securing the upper portion of the elongated body generally aligned with the lower portion of the elongated body, wherein the  
15 breakaway support post will resist a rail face impact with the guardrail, and wherein an impact with one end of the attached guardrail will tend to rotate the upper portion of the elongated body relative to the lower portion of the elongated body, wherein the second means  
20 includes:

a first plate coupled to the upper portion, the first plate having a first opening and a second opening therethrough;

25 a second plate coupled to the lower portion, the second plate having a third opening and a fourth opening therethrough, a portion of the first plate being disposed adjacent to a portion of the second plate, so that the first and third openings are aligned and the second and fourth openings are aligned;

30 a pivot bolt extending through the first and third openings;

a shear bolt extending through the second and fourth openings and being adapted to shear in response to a force to allow pivotal movement of the upper portion  
35 relative to the lower portion around the pivot bolt;

the shear bolt having a diameter less than the diameter of the pivot bolt;

5 the pivot bolt and the shear bolt extending in a strong direction approximately perpendicular to the guardrail, wherein the support post exhibits a high mechanical strength in the strong direction; and

10 the support post having a weak direction generally perpendicular to the strong direction, wherein the support post exhibits a low mechanical strength in the weak direction.

12. The breakaway support post of Claim 11, further including:

5 a third plate coupled to the upper portion on a side opposite the first plate, the third plate having a fifth opening and a sixth opening therethrough;

10 a fourth plate coupled to the lower portion on a side opposite the second plate, the fourth plate having a seventh opening and an eighth opening therethrough, a portion of the third plate being disposed adjacent to a portion of the fourth plate so that the fifth and seventh openings are aligned and the sixth and eighth openings are aligned, and the pivot bolt further extending through the fifth and seventh openings in the strong direction; and

15 a further shear bolt extending through the sixth and eighth openings in the strong direction, the shear bolts being co-axial with each other, the further shear bolt having a head at one end, and threads at an opposite end, and including a further nut, the further nut engaging the threads of the further shear bolt, the further shear bolt  
20 having a diameter less than the diameter of the pivot bolt, and the further shear bolt being adapted to shear in response to a force to allow pivotal movement of the upper portion relative to the lower portion around the  
25 pivot bolt.

13. The breakaway support post of Claim 12, wherein each of the first, second, third and fourth plates further include an inner side and an outer side, the  
30 outer side of the first plate having a portion disposed adjacent to a portion of the inner side of the second plate, and a portion of the inner side of the third plate being disposed adjacent to a portion of the outer side of the fourth plate.

35

14. The breakaway support post of Claim 13, wherein  
a head of the pivot bolt is disposed adjacent to the  
outer side of the second plate, and wherein a nut  
engaging threads of the pivot bolt is disposed adjacent  
5 to the outer side of the third plate.

15. The breakaway support post of Claim 14, wherein  
a head of a first of the shear bolts is disposed adjacent  
to the outer side of the second plate, wherein a nut  
10 engaging respective threads of the first of the shear  
bolts is disposed adjacent to the outer side of the first  
plate, wherein a head of a second of the shear bolts is  
disposed adjacent to the outer side of the third plate,  
and wherein a nut engaging respective threads of the  
15 second of the shear bolts is disposed adjacent to the  
inner side of the fourth plate.

16. The breakaway support post of Claim 12 wherein  
the shear bolt and the pivot bolt are generally  
20 vertically aligned with each other and wherein the first  
and second plates each have a first edge facing toward  
the direction of an expected impact from the weak  
direction and a second edge facing away from the  
direction of the expected impact from the weak direction,  
25 the pivot bolt being disposed closer to the second edge  
of the plates than to the first edge thereof, and wherein  
the shear bolts are disposed closer to the first edge  
than to the second edge thereof.

17. The breakaway support post of Claim 16, further including a first chamfer disposed between a bottom edge and a lower portion of the second edge of the first plate, and a second chamfer disposed between a top edge and an upper portion of the second edge of the second plate, the chamfers being positioned so that the upper portion of the elongated body may rotate relative to the lower portion of the elongated body free of engagement between the second and first plates and the upper and lower portions, respectively.

18. The breakaway support post of Claim 11, wherein the first opening is a recess provided in an edge of one of the plates.

19. A highway guardrail system having an elongated guardrail mounted on a plurality of support posts comprising:

5 at least one support post having a strong direction generally perpendicular to the guardrail, and a weak direction generally parallel to the guardrail, wherein the support post exhibits a high mechanical strength in the strong direction, and the support post exhibits a lower mechanical strength in the weak direction than in  
10 the strong direction, and the support post including an elongated body having an upper portion and a lower portion, the lower portion having a configuration for installation adjacent to a roadway;

15 means for attaching the guardrail to the support post adjacent to an upper end of the upper portion of the support post;

coupling means for releasably retaining the upper portion in an upright position relative to the lower portion, the coupling means having a greater resistance  
20 to forces exerted on the upper portion in the strong direction than to forces exerted on the upper portion in the weak direction whereby a force exerted in the weak direction which is greater than a predetermined amount of force will permit the upper portion to move away from the upright position relative to the lower portion;  
25

a cable having a first end and a second end; and

30 means for releasably maintaining the first end of the cable in an initial position relative to the post when the upper portion is in the upright position relative to the lower portion and for permitting the first end of the cable to move away from the initial position when the upper portion moves away from the upright position.

20. The highway guardrail system of Claim 19,  
wherein the coupling means permits the upper portion to  
physically separate from the lower portion as the upper  
portion moves away from the upright position relative to  
the lower portion.

21. The highway guardrail system of Claim 20,  
wherein the cable releasing means allows the cable to  
move freely in relation to the upper and lower portions  
during the separation of the upper portion from the lower  
portion.

22. The highway guardrail system of Claim 21,  
wherein the cable releasing means includes an anchor  
plate having the cable coupled thereto, the anchor plate  
engaging the support post and being disposed adjacent to  
the upper portion when the upper portion is in the  
upright position.

23. The highway guardrail system of Claim 22,  
wherein the anchor plate has an aperture therethrough and  
wherein the cable extends through the aperture, and  
including a retention part coupled to the cable on a side  
of the plate remote from the second end of the cable so  
as to prevent relative movement of the cable with respect  
to the anchor plate in a direction corresponding to  
movement of the anchor plate toward the first end of the  
cable.

24. The highway guardrail system of Claim 23,  
wherein the cable extends between the upper portion and  
the lower portion and is engageable with the upper  
portion, and wherein the second end of the cable is  
coupled to the highway guardrail system at a location  
remote from the first end.

25. The highway guardrail system of Claim 19, wherein the coupling means further comprises:

5 a first pivot pin portion and a second pivot pin portion, the upper portion of the support post being rotatable relative to the lower portion of the support post about the first and second pivot pin portions;

10 a first plate having a first opening therethrough, having a first outwardly facing edge portion which is engageable with the first pivot pin portion, and being secured to a lower end of the upper portion;

15 a second plate having a second opening and a third opening therethrough, the second plate being secured to an upper end of the lower portion, the second plate being disposed adjacent to the first plate so that the first opening is aligned with the second opening, and wherein the first pivot pin portion extends through the third opening;

20 a third plate having a fourth opening therethrough and a second outwardly facing edge portion which is engageable with the second pivot pin portion, the third plate being secured to the lower end of the upper portion at a location spaced from the first plate;

25 a fourth plate having fifth and sixth openings therethrough, and being secured to the upper end of the lower portion at a location spaced from the second plate, the fourth plate being disposed adjacent to the third plate so that the fourth opening is aligned with the fifth opening, the third opening being aligned with the sixth opening and the second pivot pin portion extending through the sixth opening; and

30 a first shear pin portion and a second shear pin portion, the first shear pin portion extending through the first and second openings, the second shear pin portion extending through the fourth and fifth openings, 35 the first and second shear pin portions being adapted to

5 shear in response to a force to allow rotational movement of the upper portion relative to the lower portion about the first and second pivot pin portions, the first and second pivot pin portions and the first and second shear pin portions extending in the strong direction approximately perpendicular to the plates.

26. The highway guardrail system of Claim 25, wherein the first, second, third and fourth plates each  
10 comprise a bottom edge and a side edge, each side edge facing away from the weak direction of the respective plate thereof, wherein when the upper portion is in the upright position the first outwardly facing edge portion and the second outwardly facing portion edge each extend  
15 at an incline from an end of the bottom edge of their respective plates to an end of an edge facing away from the weak direction of their respective plates, wherein the first outwardly facing edge portion and the second outwardly facing edge portion each have a recess disposed therein, wherein the recesses are aligned with the third  
20 opening and the sixth opening, and wherein the first pivot pin portion is engageable with the recess of the first outwardly facing edge portion and the second pivot pin portion is engageable with the recess of the second outwardly facing edge portion, the first plate being  
25 rotatable about the first pivot pin portion relative to the second plate and the third plate being rotatable about the second pivot pin portion relative to the fourth plate, the first plate and the third plate each  
30 separating from the second plate and the fourth plate, respectively, after a predetermined amount of rotational movement of the first plate and the third plate relative to the second plate and the fourth plate, respectively.

27. The highway guardrail system of Claim 25,  
further comprising a further support post and a rigid  
strut, the strut having a first end coupled to the upper  
end of the lower portion by one of the pivot pin portions  
5 and a second end coupled to the further support post.

# INTERNATIONAL SEARCH REPORT

I. International Application No

PCT/US 99/30463

A. CLASSIFICATION OF SUBJECT MATTER  
IPC 7 E01F15/04 E01F9/018

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 E01F

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	WO 98 50637 A (EXODYNE TECHNOLOGIES INC) 12 November 1998 (1998-11-12) cited in the application page 5, line 14 -page 7, line 13 page 25, line 12 - line 28 page 26, line 31 -page 27, line 23; figures 4-6,15A-16	1-27

☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

### \* Special categories of cited documents:

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

- "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- "A" document member of the same patent family

Date of the actual completion of the international search

20 April 2000

Date of mailing of the international search report
